For those of us who have recently seen the light and converted, how about showing us how to convert protected wma files to something useable. A quick google search offers lots of applications but user reviews are often conflicting.

I think the fact you are looking for protected WMA on a Mac is a non starter, remove the DRM and then VisualHub is the tool you are looking for.

Remember removing DRM hurts the people who lovingly screwed you into buying it. You wouldn't steal a car would you? Well if there was no form of DMV registration, or license plates and keys where in the ignition I bet you would you bunch of thieving bastards! Damn did I think or write all that?
